The role of dynamics-microphysicsradiation interactions in maintenance of Arctic mixed-phase boundary layer clouds

An assessment using ISDAC-based simulations

Mikhail Ovchinnikov (PNNL) Alexei Korolev (Env Canada) Jiwen Fan (PNNL), Hugh Morisson (NCAR) with many thanks to the ISDAC team

Arctic mixed-phase clouds

Both liquid and ice particles are present

- Persistent
- 100's of kilometers
- hours and days
- Strong radiative impact

Pacific Northwest NATIONAL LABORATORY

Previous assessments of mixed-phase cloud simulations

- Large spread in liquid and ice water paths among models (CRM & SCM) for the same case, initial profiles, large scale forcing, etc. (M-PACE intercomparison)
- Uncertainty in ice nucleation mechanisms plays a big role

M-PACE results (Klein et al. 2009)

Previous assessments of mixed-phase cloud simulations

- ... but constraining ice number does not eliminate LWP spread (SHEBA intercomparison)
- For many models there is a sharp transition from mixed-phased to ice-only clouds when N_i is increased
- What are the causes? Is this sensitivity real? Can it be reproduced in large-scale models?
- Dynamics-microphysics-radiation interactions are important and need to be understood better?

SHEBA results (Morrison et al. 2011)

Indirect and Semi-Direct Aerosol Campaign (ISDAC) 26 April 2008, Flight 31

- Quasi-steady state cloud (lasted for many hours)
- Shallow < 300 m (i.e., narrow temperature range)
- Flat top (weak entrainment)

 Dominant diffusional growth, mostly dendrites, little or no collision/coalescence, aggregation, or riming

ISDAC FLT31: Initial profiles and model's setup

- Elevated mixed-layer with a temperature inversion at the top and a slightly stable and moister layer below
- Surface heat fluxes = 0, snow/ice covered surface

SAM v6.7.5

 $50 \times 50 \times 20 \text{ m}^3$ resolution

256 x 128 x 120 domain, $\Delta t=2$ s

Bin (size-resolved) microphysics for liquid and ice

Liquid-only spin-up for 2 hrs

Constrained ice number (N_i)

BASE: $N_i = 0.5 L^{-1}$ NO_ICE: $N_i = 0$ HI_ICE: $N_i = 2 L^{-1}$

ISDAC FLT31: Base case cloud properties (Ni=0.5 L-1)

Nonlinear N_i effects or Life and death of a mixed-phase cloud

- Liquid cloud layer is stable with the observed *N*_i
- Dissipates in ~5 hours with quadrupled N_i
- What processes destroy the liquid ?

Untangling interactive processes

Ice can affect:

- Moisture content
- Temperature
- Radiative cooling (directly and indirectly through the reduction of the liquid water content)

Feedbacks to dynamics (turbulence or circulation strength, buoyancy flux)

Feedbacks to ice and

liquid-to-ice partitioning

Pacific Northwest

Changes in 30 min after the first ice

Linear & non-linear responses to changes in N_i

• Initial changes in LWC, IWC and Q_{rad} are proportional to N_i

• Changes in buoyancy flux and vertical velocity variance are non-linear

Quantifying the dynamical effects

Convective velocity scale $w^{*3} = 2.5 \int_{0}^{z_{i}} \langle w'b' \rangle dz$

Buoyancy integral ratio (BIR)

$$BIR = -\int_{\substack{z < z_b \text{ where} \\ \langle w'b' \rangle < 0}} \left\langle w'b' \right\rangle dz / \int_{all \text{ other } z} \langle w'b' \rangle dz$$

For warm stratocumulus BIR > 0.15 for decoupling

Bretherton and Wyant [1997]

Feedbacks to dynamics (turbulence or circulation strength)

Ice can affect vertical buoyancy flux by

- changing LW radiative cooling
- releasing latent heat during depositional growth

Sensitivity to radiation and latent heat

HI_ICE: N_i =2 L⁻¹
FXD_RAD: Fixed radiation
NO_LHi: Ignore latent heat of vapor deposition on ice

NATIONAL LABORATORY

Radiation and latent heat effects

Expectedly

 Longwave cooling – LWP feedback is important

Surprisingly

• Changes in buoyancy flux profile due to latent heat of deposition may be equally important

Ovchinnikov et al., 2011, JGR, (submitted)

ISDAC – based model intercomparison

Plans, logistics, etc

Atmospheric System Research (ASR/ARM) & GCSS

- **ASR**: Data for initialization, forcing and evaluating the simulations
- **GCSS / GASS:** Broader participation, vast model assessment and boundary/mixed layer modeling expertise

Target models: LES/CRM (SCM, Regional to follow?)

Setup details under development:

- Initial profiles, large-scale subsidence, spatial resolution, data format
- Timeline:
 - Case description (Summer 2011)
 - First model results (Fall 2011)
 - Final results & workshop (Summer 2012)
